                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human lipocortin-V was isolated from a lambda gt10 human peripheral blood lymphocyte cDNA library with rat lipocortin-V cDNA of lambda RLipo V-1 as probe. Lipocortins are anti-inflammatory agents and can be used to treat arthritic, allergic, dermatologic, ophthalmic, and collagen diseases. See also AAN90598, AAN90599, and AAP91362

The CPB-1 acts as a growth nutrition factor for nerve cells and the agent containing it is useful for the prevention and treatment of various diseases such as senile dementia and brain vessel lessions. The current agent is derived from human placentae and are free of side effects and are harmless to the living body
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 3; 5pp; Japanese.

An early manifestation of apoptosis is the loss of the asymmetric distribution of plasma membrane phospholipids, which results in exposure of anionic phospholipids on the extracellular leaflet of the plasma membrane. The GFP-annexin V fusion proteins are used for the detection of apoptotic cells by flow cytometry or fluorescent microscopy. The fusion proteins provide for homogeneously labelled annexin, with fluorescence properties that do not change upon binding membrane of FITC-annexin V fluorescence by 40-50% occurs upon binding phospholipid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          genes (I) in a test sample or determining the expression profile of gene group in the sample comprising genes selected from (I). The met is useful for examining the ischaemic genes selected from (I). The met ischaemia, occlusive ischaemia or vasospastic ischaemia) by measurin expression levels of particular genes (ABI99202 to ABI9912, encodin profile sequences in ABB57020 to ABB57374) or by determining the expression profile of a gene group comprising these genes. The expression profile of a gene group comprising these genes are used as an indicator when screening for ischaemic condition improving drugs or therapeutics for ischaemic diseases. ABI99913 and ABI99914 represent primers for a mouse ischaemic condition related sequence, which are in the exemplification of the present invention

-!- SUBUNIT: Monomer. Binds ATRX (By similarity).

-!- DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.

-!- SIMILARITY: Belongs to the annexin family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Kaneko N., Ago H., Matsuda R., Inagaki E., Miyano M.; "Crystal structure of annexin V with its ligand K-201 channel activity inhibitor.";

-!- FUNCTION: This protein is an anticoagulant protein that indirect inhibitor of the thromboplastin-specific comple is involved in the blood coagulation cascade.
-!- SUBUNIT: Monomer. Binds ATRX (By similarity).
-!- DOMAIN: A pair of annexin repeats may form one binding s calcium and phospholipid.
-!- SIMILARITY: Belongs to the annexin family.
-!- SIMILARITY: Contains 4 annexin repeats.

"Molecular cloning and characterization of annexin V-binding proteins
"Molecular cloning and characterization of annexin V-binding proteins
with highly hydrophilic peptide structure.";

J. Neurochem. 67:89-97(1996).

-!- FUNCTION: This protein is an anticoagulant protein that acts as ar
indirect inhibitor of the thromboplastin-specific complex, which
is involved in the blood coagulation cascade.

-!- SUBUNIT: Monomer. Binds ATEX and DNMT1.

-!- DOMAIN: A pair of annexin repeats may form one binding site for
calcium and phospholipid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  [2]

                                                                                                                                             ifferential expression of annexin V during spermatogenesis in the freential expression of annexin V during spermatogenesis in the Cynops pyrrhogaster.";

Genes Evol. 206:64-71(1996).

FUNCTION: Calcium/phospholipid-binding protein which promotes membrane fusion and is involved in exocytosis (By similarity).

DOMAIN: A pair of annexin repeats may form one binding site for calcium and phospholipid.

SIMILARITY: Belongs to the annexin family.

SIMILARITY: Contains 4 annexin repeats.

DISEASE: Antibodies against ANXAll are present in sera patients with various autoimmune diseases, predominantly from patients with rheumatoid arthritis, systemic lupus erythematosus, or Sjogren's syndrome.

SIMILARITY: Belongs to the annexin family.

SIMILARITY: Contains 4 annexin repeats.
                                                                                                                                                                                             602572;
